Familiar Territory: A Survey of Legal Precedents for the Clean Power Plan

Richard L. Revesz, Denise A. Grab, and Jack Lienke

A coalition of states, utilities, energy producers, and other industry groups has brought a challenge in the U.S. Court of Appeals for the District of Columbia (D.C.) Circuit against the U.S. Environmental Protection Agency’s (EPA’s) Clean Power Plan (CPP), which limits carbon dioxide (CO₂) emissions from the nation’s existing power plants pursuant to §111(d) of the Clean Air Act (CAA). (A competing cohort of states, municipalities, companies, and environmental organizations has intervened in support of the rule.) As of this writing, merits briefing has yet to begin, but the petitioners offered a preview of their arguments in a set of motions to stay the CPP pending resolution of their suit. In support of the stay requests, the petitioners filed dozens of declarations from state government officials and industry representatives, many of which made exaggerated claims regarding the “unprecedented” nature of the CPP. In this Comment, we highlight a wide variety of regulations from the CAA’s 45-year history that provide substantial precedent for the flexible design of the CPP.

I. Precedents for the CPP’s Inclusion of Beyond-the-Fenceline Pollution Reduction Measures

In order to calculate emission guidelines for existing sources of pollution under §111(d), EPA must first identify the “best system of emission reduction which . . . has been adequately demonstrated” (BSER) for the relevant pollutant and source category. For CO₂ emissions from existing power plants, EPA has determined that the BSER includes a combination of three building blocks: (1) improving the heat rate—that is, the efficiency with which fuel is converted to electricity—of coal-fired steam plants; (2) substituting increased generation from lower-emitting existing natural gas-fired “combined cycle” plants for generation from higher-emitting existing steam plants (which are mostly coal-fired); and (3) substituting increased generation from zero-emitting new renewable capacity—such as wind and solar facilities—for generation from both existing coal-fired plants and existing gas-fired plants.

Several declarations filed by opponents of the CPP assert that the rule’s reliance on “beyond-the-fenceline” measures for reducing pollution (building blocks 2 and 3), as opposed to just technological or operational requirements imposed on individual sources (building block 1), has no precedent under CAA §111. For example, one New Jersey official claims that the “requirement that [New Jersey] regulate ‘outside the fence’ of affected [electric generating units] is an unprecedented regulatory approach under Section 111 of the Clean Air Act.” Similarly, the president of an energy institute affiliated with the U.S. Chamber of Commerce insists that “EPA has never asserted the authority under Clean Air Act [§]111 to set standards that look beyond the boundaries of individual regulated facilities to mandate systemic changes.”

Other declarants suggest that beyond-the-fenceline regulation is unprecedented not just under §111, but under the CAA as a whole. A Wyoming official, for example, claims that the CPP’s “outside the fence” control measures are unlike any other Clean Air Act requirements [the state’s Department of Environmental Quality] implements. Likewise, a West Virginia declarant asserts

Note: The authors will be filing an amicus brief in support of the U.S. Environmental Protection Agency in West Virginia v. EPA, No. 15-1363 (D.C. Cir.).

5. 80 Fed. Reg. at 64707.
that the CPP’s “reliance on measures outside the affected facilities’ boundaries (fence-line) . . . are entirely unprecedented for any state.”

The declarants’ claims echo an earlier, somewhat narrower argument made by other opponents of the CAA, who acknowledge that EPA has previously allowed beyond-the-fenceline reduction techniques as a means of complying with emission limits, but maintain that the availability of such techniques has never before been taken into account when determining the stringency of those limits.10

In fact, EPA previously promulgated several rules—under both §111 and other provisions of the CAA—that incorporate beyond-the-fenceline strategies for reducing emissions. In a number of these rulemakings, beyond-the-fenceline reduction techniques were used not only as a compliance mechanism, but also to determine the stringency of the relevant emission limits, sometimes justifying more stringent restrictions than would otherwise have been imposed.

Regulations for which stringency was informed by beyond-the-fenceline reduction techniques include the Clean Air Mercury Rule, issued under §111; emission guidelines for municipal waste combustors and medical waste incinerators, issued jointly under §111 and §129; the Cross-State Air Pollution Rule and its predecessors, issued pursuant to the Good Neighbor Provision of §110; the regional haze trading program, approved under §169A; lead standards for gasoline, issued under §211; and emission standards for motor vehicles, issued under §202. We discuss each of these precedents in more detail below.

A. Beyond-the-Fenceline Rulemaking Under §111

1. Clean Air Mercury Rule

Under the George W. Bush Administration in 2005, EPA issued the Clean Air Mercury Rule (CAMR), which set statewide targets for mercury emissions from power plants and allowed for intersource and interstate trading of emission allowances.11 By its very nature, an emission trading scheme reaches beyond the fencelines of individual plants, allowing a group of regulated sources to apportion a collective reduction burden among themselves based on their relative costs of abatement. Notably, emission trading was not merely a permissible means of complying with CAMR, but was also identified by EPA as a component of the “best system of emission reduction” for mercury from power plants.12 In other words, EPA took the availability of trading into account when determining the appropriate stringency of the rule’s emission budgets.

In proposing and enacting CAMR, EPA explained why emission trading is justified under §111(d). Among other things, the Agency noted that “the term ‘standard of performance’ is not explicitly defined [in §111] to include or exclude an emissions cap and allowance trading program.”13 “Nor,” EPA pointed out, “do any other provisions of [§111(d)] indicate that the term ‘standard of performance’ may not be defined to include a cap-and-trade program.”14 Accordingly, EPA amended the §111 implementing regulations to provide that a state’s “[e]mission standards shall either be based on an allowance system or prescribe allowable rates of emissions except when it is clearly impracticable.”15

Though CAMR was ultimately vacated by the D.C. Circuit, the reversal was on grounds unrelated to trading or the stringency of the rule’s emission budgets, and the language regarding allowance systems in §111’s implementing regulations remains in place.16

2. Emission Guidelines for Large Municipal Waste Combustors

CAMR was not the first §111(d) rule to look beyond the fencelines of individual sources. Under the Clinton Administration in 1995, EPA incorporated beyond-the-fenceline reduction strategies into its emission guidelines for large municipal waste combustors, issued jointly under §§111(d) and 129.17 The guidelines allowed regulated entities both to average the nitrogen oxides (NOx) emission rates of multiple units within a single large plant and to trade emission credits with other plants.18 Further, plants that chose to take advantage of emission averaging were subject to tighter emission guidelines than those that did not.19 Thus, as in CAMR, the availability of beyond-the-fenceline reduction techniques affected the stringency of the municipal waste combustors rule.

3. Emission Guidelines for Medical Waste Incinerators

In 1997, also under the Clinton Administration, EPA issued another set of joint §§111(d) and 129 emission guidelines aimed at medical waste incinerators. These guidelines also looked beyond the fences of individual sources, requiring owners of regulated incinerators to develop waste management programs that could include “paper, cardboard, plastics, glass, battery, or metal recycling,” and were designed to “reduce the volume of waste to be incinerated, and thereby reduce the amount of air pollution emissions associated with that waste.” Implementing such programs necessarily involved actions outside the walls of individual incinerators. As in the previous examples, then, the medical waste incinerator rule’s stringency was affected by beyond-the-fenceline reduction techniques.

B. Beyond the Fenceline Rulemaking Under Other CAA Sections

EPA has also employed beyond-the-fenceline reduction techniques in regulations issued under CAA provisions other than §111, even where those provisions do not expressly authorize such an approach. As with the §111 precedents, in these rulemakings, EPA not only allowed beyond-the-fenceline reduction techniques as a compliance mechanism, but also took such techniques into account when determining the stringency of emission limits.

I. Trading Under the Good Neighbor Provision

EPA incorporated emission trading into a series of rules issued under §110(a)(2)(D), commonly known as the Good Neighbor Provision, which prohibits “sources” in upwind states from emitting pollution in amounts that “significantly contribute” to a downwind state’s failure to attain or maintain the national ambient air quality standards. In the 1998 NO, SIP Call, promulgated during the Clinton Administration; the 2005 Clean Air Interstate Rule, promulgated during the Obama Administration, EPA incorporated emission trading into a series of rules issued under CAA provisions other than §111, even where those provisions do not expressly authorize such an approach. As with the §111 precedents, in these rulemakings, EPA not only allowed beyond-the-fenceline reduction techniques as a compliance mechanism, but also took such techniques into account when determining the stringency of emission limits.

EPA has also used emission trading to address regional haze under CAA §169A. Under the Obama Administration in 2012, the Agency approved a regional trading program proposed by a group of western states and municipalities to address their collective contributions to haze in the Colorado Plateau. In approving the trading program, EPA found that it would achieve greater overall reductions than the installation of “Best Available Retrofit Technology” at individual sources. In other words, as in previous examples, the incorporation of beyond-the-fenceline techniques enabled a more stringent reduction target. The U.S. Court of Appeals for the Tenth Circuit upheld the regional haze trading program in 2014.

EPA has also, for decades, taken a beyond-the-source approach to its regulation of mobile sources of pollution under Title II of the CAA. For example, under the Reagan Administration in 1982, EPA promulgated a §211 standard...
Precedents for the CPP’s Shifting of Generation From One Energy Source to Another

In addition to asserting that the use of beyond-the-fenceline strategies is unprecedented under the CAA, some declarants claim that the CPP is the first CAA regulation to shift generation from relatively dirtier sources of energy to relatively cleaner sources. For example, an Ohio official states that the CPP’s “reliance on the reduction of demand from a particular source of energy . . . is entirely unprecedented.”39 This statement is echoed almost verbatim by at least three other declarants.40 In reality, substantial precedent exists for programs under the CAA that influence the type of fuel used for the production of electricity. Indeed, implementation of the CAA has repeatedly, over more than four decades, resulted in fundamental shifts in the fuel balance used in the power sector throughout the United States. We provide a representative (not comprehensive) set of examples below.

A. Programs That Shifted Demand to Low-Sulfur Coal

Some programs have shifted demand from high- to low-sulfur coal. For example, EPA’s first-ever sulfur dioxide performance standard for new power plants, promulgated under the Nixon Administration in 1971, was set at a level that could be satisfied either by installing scrubbers on plants using high-sulfur eastern coal or by burning low-sulfur western coal.42 EPA expected the standard to encourage plants in some states to shift from high-sulfur coal to low-sulfur coal.

The Title IV acid rain trading program, established as part of the CAA Amendments of 1990, further encouraged the substitution of low-sulfur coal for high-sulfur coal. More than one-half of the plants regulated during the first phase of that program complied by increasing their use of low-sulfur coal rather than employing scrubbers.43

B. Programs That Shifted Demand to Natural Gas

Other EPA regulations have, like the CPP, encouraged a shift from coal to natural gas. In 2011, for example, EPA predicted that its Mercury and Air Toxics Standards (MATS) would result in a 1.3% decrease in coal generation and a 3.1% increase in natural gas generation between 2009 and 2015.44 Also in 2011, EPA estimated that CSAPR would result in a 1.9% decrease in coal generation and a 4.1% increase in natural gas generation between 2009 and 2014.45

III. Conclusion

As the above examples demonstrate, there is ample precedent under the CAA both for the issuance of regulations that rely on beyond-the-fenceline pollution reduction techniques, such as emission trading, and for the issuance of regulations that influence the type of fuel used in the production of electricity.
