Attn: Appliance and Equipment Standards Program, U.S. Department of Energy

Re: Energy Conservation Program: Energy Conservation Standards for Small Electric Motors

Docket No.: EERE-2019-BT-STD-0008

The Institute for Policy Integrity (“Policy Integrity”) at New York University School of Law¹ respectfully submits comments on the Department of Energy (“DOE”)’s recent request for information on the energy conservation standards for small electric motors.² Policy Integrity is a non-partisan think tank dedicated to improving the quality of government decisionmaking through advocacy and scholarship in the fields of administrative law, economics, and public policy.

In the request for information, DOE asked for input on conducting its national impact analysis, including its emissions analysis. DOE should, as it has in the past, continue to monetize the full climate benefits of greenhouse gas emissions reductions, using the best estimates, which were derived by the Interagency Working Group, and should factor these benefits into its choice of the maximum efficiency level that is economically justified, consistent with its statutory requirement to assess the national need to conserve energy.

DOE Should Monetize the Full Benefits of Emission Reductions

DOE asks for input on the kinds of analysis it undertakes to select which efficiency level is the maximum level that is economically justified, including the national impact analysis and the emissions analysis.³ The U.S. Court of Appeals for the Seventh Circuit has ruled that DOE’s statutory mandate to assess “the need for national energy...conservation” requires the agency to consider environmental effects. In particular, the Seventh Circuit ruled that in order for DOE “[t]o determine whether an energy conservation measure is appropriate under a cost-benefit analysis, the expected reduction in *environmental costs needs to be taken into account.*”⁴ In other words, correcting the market failure of environmental

¹ This document does not purport to present New York University School of Law’s view, if any.

³ 84 FR at 14027 (This request is meant “to help DOE determine whether amended standards for direct heating equipment would result in significant energy savings and whether such standards would be technologically feasible and economically justified.”).

⁴ *Zero Zone v. Dept. of Energy*, 832 F.3d 654, 677 (7th Cir. 2016) (emphasis added).

externalities must be part of DOE's consideration in analyzing the national impact and selecting the maximum economically justified efficiency level.

To that end, the Department must fully account for the benefits from greenhouse gas emissions reductions that come from the use of more energy efficient appliances. DOE seems to agree, having listed "monetization of emissions reduction benefits" as a key analysis that must be conducted during development of a proposed energy conservation standard.⁵ To fulfill this requirement, the Department should monetize greenhouse gas emissions reduction benefits using the Interagency Working Group ("IWG")'s social costs of greenhouse gases estimates, as it has in past energy conservation program actions.⁶

DOE should continue to use the global estimate of the social cost of greenhouse gases

Specifically, DOE should use global estimates of the social costs of greenhouse gases for the proposal's national impact analysis and as the primary consideration in selecting the standards. In August 2016, the U.S. Court of Appeals for the Seventh Circuit determined that a global perspective on climate damages was the reasonable approach for DOE to take in setting energy conservation standards.⁷

Opponents of climate regulation have long challenged the global number in court and other forums, and often attempted to use the Office of Management and Budget's *Circular A-4* guidance on regulatory impact analysis as support.⁸ Specifically, opponents have seized on *Circular A-4*'s instructions to "focus" on effects to "citizens and residents of the United States," while any significant effects occurring "beyond the borders of the United States . . . should be reported separately."⁹ Importantly, despite this language and such challenges, the U.S. Court of Appeals for the Seventh Circuit had no trouble concluding that a global focus for the social cost of greenhouse gases was reasonable.¹⁰

Econ. & Pol'y 245 (2016) (citing Circular A-4 to argue against a global perspective on the social cost of carbon); *see also, e.g.*, Petitioners Brief on Procedural and Record-Based Issues at 70, in *West Virginia v. EPA*, case 15-1363, D.C. Cir. (filed February 19, 2016) (challenging EPA's use of the global social cost of carbon).

⁹ Circular A-4 at 15. Note that A-4 slightly conflates "accrue to citizens" with "borders of the United States": U.S. citizens have financial and other interests tied to effects beyond the borders of the United States, as discussed further below.

¹⁰ *Zero Zone v. Dept. of Energy*, 832 F.3d 654, 679 (7th Cir., 2016). ("AHRI and Zero Zone [the industry petitioners] next contend that DOE [the Department of Energy] arbitrarily considered the global benefits to the environment but only considered the national costs. They emphasize that the [statute] only concerns "national energy and water conservation." In the New Standards Rule, DOE did not let this submission go unanswered. It explained that climate change "involves a global externality," meaning that carbon released in the United States affects the climate of the entire world. According to DOE, national energy conservation has global effects, and, therefore, those global effects are an appropriate consideration when looking at a national policy. Further, AHRI and Zero Zone point to no global costs that should have been considered alongside these benefits. Therefore, DOE acted reasonably when it compared global benefits to national costs.")

Circular A-4's reference to effects “beyond the borders” confirms that it is appropriate for agencies to consider the global effects of U.S. greenhouse gas emissions. While *Circular A-4* may suggest that most typical decisions should focus on U.S. effects, the *Circular* cautions agencies that special cases call for different emphases, noting that “[d]ifferent regulations may call for different emphases in the analysis, depending on the nature and complexity of the regulatory issues.”¹¹ In fact, *Circular A-4* elsewhere assumes that agencies’ analyses will not always be conducted from purely the perspective of the United States, as one of its instructions only applies “as long as the analysis is conducted from the United States perspective,”¹² suggesting that in some circumstances it is appropriate for the analysis to be global. Because climate change represents a global tragedy of the commons, regulations that affect greenhouse gas emissions are precisely the kind of regulation that, according to the principles of *Circular A-4*, requires a “different emphasis”—namely, a global perspective on climate damages.¹³

DOE should not attempt to calculate and base its proposal’s justification on a domestic-only value of the social cost of carbon. Not only is it inconsistent with *Circular A-4* and best economic practices to fail to estimate the global damages of U.S. greenhouse gas emissions in regulatory analyses, but existing methods for estimating a “domestic-only” value are unreliable, incomplete, and therefore inconsistent with *Circular A-4*. Indeed, in 2015, the Office of Management and Budget concluded, along with several other agencies, that “good methodologies for estimating domestic damages do not currently exist.”¹⁴ Moreover, a domestic-only estimate fails to use models built for the purpose of calculating regional damages, ignores recent literature on significant U.S. climate damages, and fails to reflect international spillovers to the United States, U.S. benefits from foreign reciprocal actions, and the extraterritorial interests of U.S. citizens including financial interests and altruism.

DOE has used the global social cost of greenhouse gases values in the recent past

In an energy conservation program rule for walk-in cooler and freezer systems released in July 2017, the Department made use of the IWG social cost of carbon estimates, including the 2.5-percent, 3-percent, and 5-percent discount rates, and global climate damages.¹⁵ In fact, in the announcement of the final standards, DOE explicitly stated that it is appropriate

¹¹ *Circular A-4* at 3. (“[Y]ou cannot conduct a good regulatory analysis according to a formula. Conducting high-quality analysis requires competent professional judgment. Different regulations may call for different emphases in the analysis, depending on the nature and complexity of the regulatory issues and the sensitivity of the benefit and cost estimates to the key assumptions.”).

¹² *Id.* at 38 (counting international transfers as costs and benefits “as long as the analysis is conducted from the United States perspective”).

¹³ For more details on the justifications for a global perspective on climate damages in regulatory analysis, see, e.g., Peter Howard & Jason Schwartz, *Think Global: International Reciprocity as Justification for a Global Social Cost of Carbon*, 42 COLUMBIA J. ENVTL. L. 203 (2017).

¹⁴ In November 2013, OMB requested public comments on the social cost of carbon. In 2015, OMB along with the rest of the Interagency Working Group issued a formal response to those comments. Interagency Working Group on the Social Cost of Carbon, *Response to Comments: Social Cost of Carbon for Regulatory Impact Analysis under Executive Order 12,866* at 36 (July 2015) [hereinafter, OMB 2015 Response to Comments].

¹⁵ 82 Fed. Reg. at 31,808.

to consider global benefits as greenhouse gas emissions accrue globally.¹⁶ Specifically, DOE found that “[t]he CO₂ reduction is a benefit that accrues globally. DOE maintains that consideration of global benefits is appropriate because of the global nature of the climate change problem.”¹⁷ The Department further stated that “preference is given to consideration of the global benefits of reducing CO₂ emissions,”¹⁸ over domestic-only benefits of emissions reductions.

In that rule, DOE also included an explanation of why the Department used the range of social costs of greenhouse gases discount rates. On the question of appropriate discount rates, DOE stated, “The central value, 3 percent, is consistent with estimates provided in the economics literature and OMB’s Circular A-4 guidance for the consumption rate of interest,”¹⁹ and that “for purposes of capturing the uncertainties involved in regulatory impact analysis, the IWG emphasizes the importance of including all four sets of SC-CO₂ values,”²⁰ which are reflected in DOE’s analysis for this 2017 rule.²¹ Using the range of discount rates and focusing on global damages is consistent with best practices and is consistent with Circular A-4, and the agency should do so in this rule.

DOE should only rely on the best available science and economics

As agencies follow *Circular A-4*’s standards for using the best available data and methodologies, they will necessarily choose similar data, methodologies, and estimates as the IWG, since the IWG’s work continues to represent the best available estimates.²² The social costs of greenhouse gases metric, developed by the federal IWG, is the best available tool for measuring the economic damages from greenhouse gas emissions because it is based on the best available science and economics and is therefore consistent with Circular A-4. It has been used in analysis for over 100 federal regulations that affect greenhouse gas emissions, as well as by a number of states in electricity and climate policy.²³ This metric takes into account the interconnected, global nature of our climate-vulnerable economy, as well as the devastating effects that climate change will have on younger and future generations.

The Department should not rely on any “interim” estimates that do not include a range of discount rates or global climate impacts. Two agencies have developed new “interim” values of the social costs of greenhouse gases following Executive Order 13,783.²⁴ Relying on faulty economic theory, these “interim” estimates drop the social cost of carbon from

²⁴ Oil and Natural Gas Sector: Emission Standards for New, Reconstructed, and Modified Sources: Stay of Certain Requirements, 82 Fed. Reg. 51,788 (Nov. 8, 2017); Waste Prevention, Production Subject to Royalties, and Resource Conservation; Delay and Suspension of Certain Requirements, 82 Fed. Reg. 46,458 (Oct. 5, 2017).

\$50 per ton in year 2020 down to as little as \$1 per ton, and drop the social cost of methane from \$1420 per ton in year 2020 down to \$58. These “interim” estimates are inconsistent with accepted science and economics. The IWG’s methodology and estimates have been repeatedly endorsed by reviewers as transparent, consensus-based, and firmly grounded in the academic literature. By contrast, the “interim” estimates ignore the interconnected, global nature of our climate-vulnerable economy, and obscures the devastating effects that climate change will have on younger and future generations. DOE should not use the “interim” social cost of greenhouse gas estimates because of their methodological flaws.²⁵

Respectfully submitted,

Iliana Paul, Policy Analyst
